

In the Claims

Please substitute the following amended claims for those currently pending:

1-18. (cancelled)

19. (withdrawn) A device for measuring the signals corresponding to the values of area or volume of at least one object within a homogeneous magnetic field, comprising:

- a. conductive coils configured tightly about the various circumferences of at least one portion of an object within a homogeneous magnetic field;
- b. fixed coils remotely located relative to the conductive coils about the object;
- c. a noise reduction coil circuit arrangement for reducing the sum of signals to zero from an unwanted magnetic field of uniform intensity that is influencing the magnetic field surrounding the object; and,
- d. current generating means for selectively providing alternating current to either one of the conductive coil means or the fixed coil means to create an induced voltage in the other coil means representative of true area or volume within the coils that are configured tightly about the various circumferences of the object portion or portions, with the signals and area/volume changing over time due to the cardiac function of the object.

20. (withdrawn) The device of claim 19 in which the conductive coils comprise electrically conductive coil loops that are equally spaced on a flexible substrate that is suitable for wearing by the object.

21. (withdrawn) The device of claim 19 in which the conductive coils comprise electrically conductive coil loops that are closed circumferential loops.

22. (withdrawn) The device of claim 19 in which the current generating means generates current with a frequency range of about 10 kHz to about 200 kHz and from about 1 milliamperes to about 1 ampere.
23. (withdrawn) The device of claim 19 in which the conductive coils comprise a plurality of coil loops which are configured tightly about the thoracic region and the abdominal region of the object.
24. (withdrawn) The device of claim 19 further comprising sensing and control means for controlling operation of the device, the sensing and control means being electrically connected to the conductive coils, the fixed coils, the noise reduction circuit, and the current generating means.
25. (withdrawn) The device of claim 24 in which the sensing and control means comprises timing and multiplex switching means for providing simultaneous area or volume measurements of both a thoracic region and an abdominal region of the object.
26. (withdrawn) The device of claim 25 in which the sensing and control means comprises multiplexing means for providing simultaneous measurement of a plurality of regions of the object utilizing either phase, frequency or time multiplexing.
27. (withdrawn) The device of claim 19 in which the current generating means comprises a constant current circuit to maintain the current in the conductive coils constant regardless of the dynamic variations of portions of the conductive coils that are configured tightly about the various circumferences of at least one portion of the object.
28. (withdrawn) The device of claim 19 in which the current generating means comprises a signal generator and a constant current amplifier electrically connected to the coils which are receiving the generated current.

29. (withdrawn) The device of claim 24 in which the sensing and control means comprises an amplifier and a rectifier electrically connected to the coils that are receiving the induced voltage from the other coils.

30. (withdrawn) The device of claim 20 in which the conductive coils are electrically connected in series so that the area A may be calculated from the measured voltage U of a single coil loop which is receiving the induced voltage by use of the formula

$$A=U \cdot k$$

wherein $k_c = a_c / U_c$; and

wherein a_c is the area of a reference coil, and U_c is the voltage reading of the volume signal when a calibration coil is attached.

31. (withdrawn) The device of claim 19 in which the fixed coils comprise a plurality of small coil elements that are configured for matching and positioning to permit the fixed coils to generate a magnetic field similar to a single large coil for either sensing an induced voltage from the conductive coils or for generating a field to create an induced voltage in the conductive coils.

32. (withdrawn) The device of claim 31 in which the plurality of small coil elements comprises three small coil elements.

33. (withdrawn) The device of claim 32 in which each of the small coil elements is wound on a ferrite core and arranged linearly with optimized positions and signal intensity weighting to generate a homogeneous magnetic field at the portion of the object being measured.

34. (withdrawn) The device of claim 19 in which the conductive coils comprise electrically conductive coil loops that are equally spaced and carried by an elastic and conformable substrate that is suitable for wearing by the object in a manner similar to a tightly fitting garment which is

configured so that the coil loops always conform to the same surface of the portion of the mammal regardless of any shape change which that portion of the object may experience during cardiac function.

35. (withdrawn) The device of claim 19 in which the conductive coils comprise electrically conductive coil loops that are spaced at constant and known intervals and which are carried by an elastic and conformable substrate that is suitable for wearing by the object in a manner similar to a tightly fitting garment which is configured so that the coil loops always conform to the same surface of the portion of the object regardless of any shape change which that portion of the object may experience during cardiac function.

36. (withdrawn) The device of claim 19 further comprising computational means for receiving a signal representative of sensed area or volume of the portion of the object and for converting the signal to true area/volume values.

37. (withdrawn) The device of claim 19 in which the noise reduction coil circuit arrangement comprises a combination of a plurality of coil orientations and coil turn numbers that bring the sum of undesired signals to zero.

38. (withdrawn) The device of claim 37 in which the noise reduction coil circuit comprises matched pairs of coils.

39. (withdrawn) A method of measuring the area or volume of an object comprising the steps of:

- a. adapting electrical circuits as coils to conform to the object surface;
- b. providing electrical circuits remotely located relative to said object;
- c. generating a constant and known current in said electrical circuits to produce a relatively homogeneous spatial sensitivity in a defined region around the object;

d. providing a noise reduction circuit to reduce the sum of undesired received signals to zero in the defined region when all the electrical circuits in the defined region are exposed to an undesired uniform magnetic field; and

e. measuring the voltage induced in the electrical circuits by a time-varying uniform magnetic field surrounding the object, whereby the change in the area or volume of the object may be calculated without calibration of said electrical circuits to said object.

40. (withdrawn) A method of measuring the area or volume of an object comprising the steps of:

- a. adapting electrical circuits to the object surface;
- b. providing electrical circuits remotely located relative to said object;
- c. generating a constant and known current into one of said electrical circuits to produce a relatively homogeneous spatial sensitivity in a defined region around the object;
- d. providing a noise reduction circuit to reduce the sum of undesired received signals to zero in the defined region; and
- e. measuring the electromagnetic inductive coupling between the electrical circuits, whereby the change in the area or volume of the object may be calculated without calibration of said electrical circuits to said object.

41. (new) A device for measuring the movement of an object comprising:

- a. first and second matched pairs of fixed coils;
- b. a patient coil configured to wrap elastically around a patient's body part;
- c. a current source coupled to, and adapted to energize, either the matched pairs of fixed coils or the patient coil; and
- d. a volume sensing element comprising whichever of the matched pairs of fixed coils or the patient coil that is not coupled to the current source;
- e. whereby the first and second matched pairs of fixed coils are arranged to reduce a sum of magnetic noise signals from remote sources to zero and to generate a relatively homogeneous magnetic field in a spatial volume occupied by the patient's body part.

42. (new) The device of claim 41, wherein the spatial volume has a center and the first and second matched pairs of fixed coils are arranged symmetrically about a vertical plane extending through the center of the spatial volume and are arranged above a horizontal plane passing through the center of the spatial volume.
43. (new) The device of claim 42, wherein the first matched pair of fixed coils are each positioned approximately 503 millimeters from the vertical plane.
44. (new) The device of claim 43, wherein the second matched pair of fixed coils are each positioned approximately 650 millimeters from the vertical plane.
45. (new) The device of claim 42, wherein the spatial volume has a bottom and wherein (a) the first matched pair of fixed coils each comprise approximately 300 turns, (b) the second matched pair of fixed coils each comprise approximately 90 turns, (c) the first matched pair of fixed coils are wound on a first pair of rods that are positioned approximately 420 millimeters above the bottom of the spatial volume, (d) the second matched pair of fixed coils are wound on a second pair of rods that are positioned approximately 510 millimeters above the bottom of the spatial volume, (e) the first matched pair of fixed coils are each positioned approximately 503 millimeters from the vertical plane, (f) the second matched pair of fixed coils are each positioned approximately 650 millimeters from the vertical plane, and (g) the spatial volume extends 250 millimeters in the vertical direction and 400 millimeters in the horizontal direction.
46. (new) The device of claim 41, wherein the current source is coupled to, and adapted to energize, the matched pairs of fixed coils, and the volume sensing element comprises the patient coil.

47. (new) The device of claim 41, wherein the current source is coupled to, and adapted to energize, the patient coil, and the volume sensing element comprises the matched pairs of fixed coils.
48. (new) The device of claim 41, wherein the spatial volume extends 250 millimeters in the vertical direction and 400 millimeters in the horizontal direction.
49. (new) The device of claim 41, wherein the first matched pair of fixed coils each comprise approximately 300 turns and the second matched pair of fixed coils each comprise approximately 90 turns.
50. (new) The device of claim 41, wherein the spatial volume has a bottom and wherein the first matched pair of fixed coils are wound on a first pair of rods that are positioned approximately 420 millimeters above the bottom of the spatial volume.
51. (new) The device of claim 50, wherein the second matched pair of fixed coils are wound on a second pair of rods that are positioned approximately 510 millimeters above the bottom of the spatial volume.
52. (new) The device of claim 41, wherein the first and second matched pairs of fixed coils are wound on first and second pairs of ferrite rods, each rod having a diameter of approximately 8 millimeters, a length of approximately 150 millimeters, and a μ value of approximately 100.
53. (new) The device of claim 41, wherein the first matched pair of fixed coils are connected electrically in opposite phases.
54. (new) The device of claim 41, wherein the device is configured to measure variations in tidal volumes in neonates less than 1000 grams.

55. (new) The device of claim 41, wherein (i) the spatial volume has a center, (ii) first and second planes both extend through the center, the first plane being perpendicular to the second plane, and (iii) the first and second matched pairs of fixed coils are arranged symmetrically about the first plane and on the same side of the second plane.

56. (new) A method of measuring the movement of an object comprising:

- a. arranging first and second matched pairs of fixed coils;
- b. wrapping a patient coil around a patient's body part;
- c. energizing either the matched pairs of fixed coils or the patient coil;
- d. sensing a volume of the body part with whichever of the matched pairs of fixed coils or the patient coil is not energized;
- e. reducing a sum of magnetic noise signals from remote sources to zero by the arrangement of the first and second matched pairs of fixed coils; and
- f. generating a relatively homogeneous magnetic field in a spatial volume occupied by the patient's body part.

57. (new) The method of claim 56, wherein the spatial volume has a center and the first and second matched pairs of fixed coils are arranged symmetrically about a vertical plane extending through the center of the spatial volume and are arranged above a horizontal plane passing through the center of the spatial volume.

58. (new) The method of claim 57, wherein the first matched pair of fixed coils are each positioned approximately 503 millimeters from the vertical plane.

59. (new) The method of claim 58, wherein the second matched pair of fixed coils are each positioned approximately 650 millimeters from the vertical plane.

60. (new) The method of claim 57, wherein the spatial volume has a bottom and wherein (a) the first matched pair of fixed coils each comprise approximately 300 turns, (b) the second

matched pair of fixed coils each comprise approximately 90 turns, (c) the first matched pair of fixed coils are wound on a first pair of rods that are positioned approximately 420 millimeters above the bottom of the spatial volume, (d) the second matched pair of fixed coils are wound on a second pair of rods that are positioned approximately 510 millimeters above the bottom of the spatial volume, (e) the first matched pair of fixed coils are each positioned approximately 503 millimeters from the vertical plane, (f) the second matched pair of fixed coils are each positioned approximately 650 millimeters from the vertical plane, and (g) the spatial volume extends 250 millimeters in the vertical direction and 400 millimeters in the horizontal direction.

61. (new) The method of claim 56, wherein energizing comprises energizing the matched pairs of fixed coils, and sensing comprises sensing with the patient coil.

62. (new) The method of claim 56, wherein energizing comprises energizing the patient coil, and sensing comprises sensing with the matched pairs of fixed coils.

63. (new) The method of claim 56, wherein the spatial volume extends 250 millimeters in the vertical direction and 400 millimeters in the horizontal direction.

64. (new) The method of claim 56, wherein the first matched pair of fixed coils each comprise approximately 300 turns and the second matched pair of fixed coils each comprise approximately 90 turns.

65. (new) The method of claim 56, wherein the spatial volume has a bottom and wherein the first matched pair of fixed coils are wound on a first pair of rods that are positioned approximately 420 millimeters above the bottom of the spatial volume.

66. (new) The method of claim 65, wherein the second matched pair of fixed coils are wound on a second pair of rods that are positioned approximately 510 millimeters above the bottom of the spatial volume.

67. (new) The method of claim 56, wherein the patient is a neonate less than 1000 grams.
68. (new) The method of claim 56, wherein (i) the spatial volume has a center, (ii) first and second planes both extend through the center, the first plane being perpendicular to the second plane, and (iii) the first and second matched pairs of fixed coils are arranged symmetrically about the first plane and on the same side of the second plane.
